Applicant(s)

DIMITROVA ET AL.

Examiner

SUMAIYA A. CHOWDHURY

Art Unit

2623

Period for Reply -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 30 January 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 2,3,5-13,17-20,24,25,29,30,33-38 and 41-44 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 2,3,5-13,17-20,24-25,29-30, 33-38, 41-44 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Final Drawing Review (PTO-849)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

Response to Arguments

1. Applicant's arguments filed 1/30/08 have been fully considered but they are not persuasive.

(a) Applicant argues "The Examiner contends that Arellano teaches a demultiplexer..." on page 11, 1st paragraph of the Remarks filed 1/30/08.

Referring to fig. 14, Arellano teaches that a content element comprises text, video, audio and image components. Referring to fig. 15, Arellano teaches that the "1996 Game" content element is demultiplexed into text and video data components. The element which performs the dividing of data into text and video data components is the demultiplexer.

(b) Applicant argues "Rather, Akella describes a system wherein a user views snapshots..." on page 12, 1st paragraph.

Applicant claims inter alia, "analyzing the snapshots for adaptive memory tracking and evolution of the user". Referring to paragraph [0025], Akella teaches historical snapshots are used to analyze trends or other findings concerning the historical data. Hence the claim limitation is met and Applicant is arguing that which is not claimed.

(c) Applicant argues "There is no suggestion in Thuraisingham or Arellano that non-monotonic reasoning is superior..." on page 12, 3rd paragraph.

Again Applicant is arguing that which is not claimed. Nowhere does Applicant claim non-monotonic reasoning is superior, nor picking non-monotonic reasoning out of the list. At most, Applicant claims using modal non-monotonic to make deductions which Thuraisingham teaches.

(d) Applicant requests to reconsider the 37 CFR 1.131 Declaration on pages 14-15 of the Remarks.

As indicated in the Office Action of 5/15/07, the concept as described in the 37 CFR 1.131 DECLARATION OF PRIOR INVENTION does not teach each element in the claim. No evidence has been submitted to show that the applicant had been diligent during the critical period. A mere allegation of diligence is not sufficient to overcome the date. 12/24/01 will continue to be considered the effective filing date.

The evidence submitted is insufficient to establish a conception of the invention prior to the effective date of the Akella reference. While conception is the mental part of the inventive act, it must be capable of proof, such as by demonstrative evidence or by a complete disclosure to another. Conception is more than a vague idea of how to solve a problem. The requisite means themselves and their interaction must also be comprehended. See *Mergenthaler v. Scudder*, 1897 C.D. 724, 81 O.G. 1417 (D.C. Cir. 1897). The applicant did not provide any facts and or documentary evidence, such as sketches, lab notebook entries, etc., as required under MPEP 715.07(I). Specifically, there is nothing showing evidence that the inventor conceived

each an every limitation of claim 10, for example, the limitation "a memory with a hierarchy of linked index nodes and content nodes" as claimed in claims 10, 11, 12, 13, 15 and 16 is not found in the evidence of conception.

The evidence submitted is insufficient to establish diligence prior to the filing date of the Bates reference to either a constructive reduction to practice or an actual reduction to practice. The applicant did not provide any evidence of diligence as required by 715.07(a). The entire period during which diligence is required must be accounted for by either affirmative acts or acceptable excuses. An applicant must account for the entire period during which diligence is required. *Gould v. Schawlow*, 363 F.2d 908,919, 150 USPQ 634,643 (CCPA 1966) (Merely stating that there were no weeks or months that the invention was not worked on is not enough.); *In re Harry*, 333 F.2d 920, 923, 142 USPQ 164, 166 (CCPA 1964) (statement that the subject matter "was diligently reduced to practice" is not a showing but a mere pleading). A 2-day period lacking activity has been held to be fatal. *In re Mulder*, 716 F.2d 1542, 1545, 219 USPQ 189, 193 (Fed. Cir. 1983). See MPEP § 2138.06 for a detailed discussion of the diligence requirement for proving prior invention.

Claim Rejections - 35 USC § 101

2. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

3. Claims 34-38, and 41-44 rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Claims 34-38, and 41-44 recite "A computer program embodying code...". However, the claim does not define a computer-readable medium or memory and is thus non-statutory for that reason (i.e., "When functional descriptive material is recorded on some computer-readable medium it becomes structurally and functionally interrelated to the medium and will be statutory in most cases since use of technology permits the function of the descriptive material to be realized"). The examiner suggests amending the claim to embody the program on computer-readable medium or equivalent in order to make the claim statutory. For example, the preamble of claim 34 should read --**A computer readable medium encoded with computer executable instructions that when executed by the computer result in:** --. Further, note that any amendment to the claim should be commensurate with its corresponding disclosure.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 3, 5, and 7-9, are rejected under 35 U.S.C. 103(a) as being unpatentable over Arellano et al. (US 2004/0128624 A1) in view of Thuraisingham (5481700)

Regarding claim 5 Arellano teaches a data processing system (fig. 7) comprising:

a demultiplexer which demultiplexes at least visual, audio, and multimedia content into data components (fig. 15; par. 0173-0176; in which multimedia [including visual and audio, TV, etc.] content is received via a network device, e.g., TV, set-top, computer; par. 696; par. 86, lines 9-10; par. 91, line 1-6; par. 103; par. 83 fig. 17, 18, 19);

one or more content analyzer routines (engines) which analyze the data components (par. 88; 91; 114; 127, lines 6-16; par. 128) to derive at least facts from the relevant user experience (interaction data; par. 88; 153; 321-322) and behavior (patterns and trends; par. 85, lines 4-6; par. 88);

a store computer routine (modeling system) which stores at least the derived facts (par. 90; 112), user experience (par. 90; 114) and behavior (par. 114), other facts (community derived facts; par. 114, lines 10-13) and information (program schedule, application specific information, delivery device characteristics, etc; par. 39, lines 6-9 par.154; par. 83; par. 118), and user inputs (par. 89) responsive to user queries (par. 105, lines 1-3,11-13; par. 127; par. 153) into an adaptive memory (fig. 18-20; par. 128; par. 174; par. 92, lines 3-6, 9-11; par. 39, lines 29-33; par. 42, lines 1-6; par. 82, lines 4-7; par. 84, line 9; par. 105, line 9; par. 193-195) with a hierarchy (par. 100, lines 5-8; par. 176; par. 177, lines 12-16; par. 890; par. 908, lines 1-5, 14-15) of linked (correlated) index (categorized) nodes (groups and subgroups of features that comprise content elements, e.g., keywords, content type, semantics, etc.) (fig. 25, 28, 30; par. 95; 112;

par. 170; 173; 176; 747-749; 881-882), each node corresponding to subcategory (subclass) of information (par. 908, lines 4-10; fig. 25, 28); and

a reasoning and fact reconciling computer routine (agent/expert; par. 85 & 16; 92; 95; par. 171, lines 6-8; par. 190, lines 6-10; par. 321-322) which controls the adaptive memory to create at least one link (similarity correlation) to a content node (par. 92, lines 7-12; par. 95, lines 4-6; par. 225; 881-882; fig. 25 & 28; in which the system creates correlation/links to the user model based on feature/feature-values of content elements for predicting and realizing user interests, preference, and behavior; par. 205 features serve as the link between the user and content) and weak links to other index nodes, which weak links do not fit into the hierarchy (creates links to other index nodes that are not based on the subcategories of information/content, i.e., the feature/feature-value nodes) (situation-action pairs, do not fit into the pragmatic feature-value hierarchy which is application specific, i.e., content based [par. 136, 138; par. 19, lines 7-11 & par. 21, lines 1-8], and are used to provide other cognitive indexing nodes, i.e., categorizing groups and sub-groups, based on a user's goals or persona, which are not connected to the application/content hierarchy; par. 139-140; par. 19, lines 4-7; par. 171, lines 10-13; fig. 13; par. 91; par. 20; par. 21, lines 16-19; par. 83).

However, Arellano fails to teach modal logic is used to control the adaptive memory.

In an analogous art, Thuraisingham teaches modal logic is used to make deductions and gives new complete answers to queries – col. 56, line 62 - col. 57, line 60, col. 47, lines 43-62, col. 49, lines 10-67, col. 51, lines 12-15.

It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify Arellano's invention to include the above mentioned limitation, as taught by Thuraisingham, for the advantage of having a machine automatically reason and draw inferences to come up with answers which are more accurate and more reliably ranked.

Regarding claim 3, Arellano and Thuraisingham disclose the claimed limitations. In particular, Arellano teaches the facts derived from content comprise a summary (characterizations) of a relevant piece of content (par. 109, lines 16-21; par. 100; par. 112).

Regarding claims 7, Arellano and Thuraisingham disclose the claimed limitations. In particular, Arellano teaches the facts derived from user behaviors include at least one record of presence of the user (par. 118-119).

Regarding claim 8, Arellano and Thuraisingham disclose the claimed limitations. In particular, Arellano teaches the facts derived from user behaviors include at least one record of queries (request) (par. 127-128; par. 105, lines 1-3,11-13; par. 153).

Regarding claim 9, Arellano and Thuraisingham disclose the claimed limitations. In particular, Arellano teaches at least one snapshot, which snapshot acts as a bias

Art Unit: 2623

toward a longer term view of user behavior (par. 90, 737; par. 190, lines 8-12; par. 29, lines 7-10; par. 39, lines 30-33; par. 128; par. 18; in which snapshots maintained for longer/continuing time period, for analyzing/finding future trends and patterns).

6. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Arrelano and Thuraisingham as applied to claim 5 above, and further in view of Maissel et al. (US 6,637,029 B1).

Regarding claim 2, Arellano teaches the facts derived from content comprise information supplemental information about the content (par. 112).

However Arellano and Thuraisingham fail to specifically disclose a name of at least one person who participated in creation of a relevant piece of content.

In an analogous art, Maissel teaches a name of at least one person who participated in creation of a relevant piece of content for filtering out content preferred by the user (col. 11, lines 14-26; col. 12, lines 16-26).

It would have been obvious to one of ordinary skill in the art at the time of the Applicant's invention to modify the system of Arellano and Thuraisingham to include a name of at least one person who participated in creation of a relevant piece of content for filtering out content preferred by the user for the added advantage of providing additional information about the user's preferences to increase the effectiveness of the user model.

7. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Arellano and Thuraisingham as applied to claim 5 above, and further in view of Aras (5872588).

Regarding claims 6, Arellano teaches the facts derived from user behaviors as discussed in claim 5 above and further teaches capturing user behavior/interactions (par. 89-90; par. 132; par. 140).

However, Arellano and Thuraisingham fails to specifically disclose at least one record of play sequence commands.

In an analogous art Aras teaches at least one record of play sequence commands for monitoring user behavior (col. 14, lines 8-20).

It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify Arellano and Thuraisingham's invention to include the above mentioned limitation, as taught by Aras, for the advantage of collecting user behavior.

8. Claims 10-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Arellano et al. (US 2004/0128624 A1) and Akella et al. (US 2002/0178146 A1) in view of Thuraisingham.

Regarding claim 10, Arellano teaches a data processing system comprising:

a memory (fig. 18-20; it is inherent to have memory in a computer environment) with a hierarchy (par. 100, lines 5-8; par. 176; par. 177, lines 12-16; par. 890; par. 908, lines 1-5, 14-15) of linked (correlated) index (categorized) and content nodes (groups and subgroups of features that comprise content elements, e.g., keywords, content type, semantics, etc.) (fig. 25, 28, 30; par. 95; 112; par. 170; 173; 176; 747-749; 881-882);

at least one processor (fig. 18, 19, 20, it is inherent to have processor in a computer server environment; par. 193, line 1-2) which perform operations to make the memory into a personal adaptive memory (fig. 18-20; par. 128; par. 174; par. 92, lines 3-6, 9-11; par. 39, lines 29-33; par. 42, lines 1-6; par. 82, lines 4-7; par. 84, line 9; par. 105, line 9; par. 193-195), the processor being programmed with code (software) to perform operations (par. 41, 82, 107, 199-200) including the following:

capturing content experienced by a relevant user (par. 190, lines 6-12; par. 84, lines 9-11; par. 88, lines 4-6; par. 89, 127, 128; par. 171, lines 1-7) and the relevant user's behaviors (par. 85, lines 5-9; par. 88, lines 5-11; par. 90; par. 91, lines 7-11; par. 92, line 3-6; par. 114, lines 3-9; par. 190, lines 12-17);

analyzing the content and behaviors to create updated content and behavior data (par. 88; 91; 114; 127, lines 6-16; par. 128; par. 105, lines 1-3, 9-13; par. 139-140); and

updating the adaptive personal memory with updated data (par. 105, lines 1-3, 9-13; par. 139-140);

at regular intervals, taking snapshots indicative of user interests (par. 90, 737; par. 190, lines 8-12; par. 29, lines 7-10; par. 39, lines 30-33; par. 128; par. 18;

However Arellano fails to specifically disclose:

analyzing the snapshots for adaptive memory tracking and evolution of the user.

wherein at least one of the analyzing and updating steps makes use of modal, non-monotonic logic.

In an analogous art Akella teaches it is desirable to analyze the snapshots in order to detect changes in user information and determine historical trends (Abstract; par. 9; par. 10, lines 1-5; par. 23, lines 1-6; par. 24; par. 27, lines 15-21).

Therefore it would have been obvious to one of ordinary skill in the art to modify the system of Arellano to include analyzing the snapshots as taught by Akella for the added advantage of reduced memory requirements and more efficiently determining when, why and how new snapshots are taken (Akella – par. 24).

However, Arellano and Akella fail to teach:

wherein the analyzing step makes use of modal, non-monotonic logic;

In an analogous art, Thuraisingham teaches modal, non-monotonic logic is used to make deductions and gives new complete answers to queries – col. 56, line 62 - col. 57, line 60, col. 47, lines 43-62, col. 49, lines 10-67, col. 51, lines 12-15.

It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify Arellano and Akella's invention to include the above mentioned limitation, as taught by Thuraisingham, for the advantage of having a machine automatically reason and draw inferences to come up with answers which are more accurate and more reliably ranked.

Regarding claim 11, Arellano in view of Akella and Thuraisingham teach the operations further comprise interfacing with the user (Arellano-par. 117-126; par. 110; par. 183; par. 154-155; par. 27, lines 10-12) and acquiring more data from the user (par. 128; par. 114, lines 7-9).

Regarding claim 12, Arellano in view of Akella and Thuraisingham teach interfacing further comprises one of recommending new content based on the adaptive personal memory (Arellano-par. 147, lines 1-8).

Regarding claim 13, Arellano in view of Akella and Thuraisingham teach determining a level of interest in a particular content (web page) responsive to one of what queries (web page request) were made (Arellano-par. 190).

9. Claims 34-38, and 41-44 rejected under 35 U.S.C. 103(a) as being unpatentable over Arellano, Akella, and Thuraisingham in view of Aras (5872588).

Regarding claims 34, 36 and 44, Arellano teaches a computer program embodying code for causing the data processing device (fig. 18, 19, 20, it is inherent to have processor in a computer server environment; par. 193, line 1-2) to perform operations (par. 82, lines 6-10; par. 89, lines 3-4; par. 41, 107, 199-200) to maintain at least one adaptive personal memory (fig. 18-20; par. 128; par. 174; par. 92, lines 3-6, 9-11; par. 39, lines 29-33; par. 42, lines 1-6; par. 82, lines 4-7; par. 84, line 9; par. 105,

line 9; par. 193-195) with information including personal information (par. 91, lines 6-10), facts derived from content experienced by at least one relevant user (par. 190, lines 6-12; par. 84, lines 9-11; par. 88, lines 4-6; par. 89, 127,128; par. 171, lines 1-7), facts derived from the relevant user's behavior (par. 85, lines 5-9; par. 88, lines 5-11; par. 90; par. 91, lines 7-11; par. 92, line 3-6; par. 114, lines 3-9; par. 190, lines 12-17), the computer program embodying code for:

capturing content experienced by a relevant user (par. 190, lines 6-12; par. 84, lines 9-11; par. 88, lines 4-6; par. 89, 127,128; par. 171, lines 1-7);

capturing the relevant user's behaviors (par. 85, lines 5-9; par. 88, lines 5-11; par. 90; par. 91, lines 7-11; par. 92, line 3-6; par. 114, lines 3-9; par. 190, lines 12-17);

updating the adaptive personal memory (par. 105, lines 1-3,9-13; par. 139-140);
periodically creating a snapshot depicting the captured relevant user's experienced content and behavior over a preceding period (par. 90, 737; par. 190, lines 8-12; par. 29, lines 7-10; par. 39, lines 30-33; par. 128; par. 18; in which the snapshot is maintained for longer/continuing time period for analyzing/finding future trends and patterns in content experienced/interacted);

analyzing the snapshot to develop patterns trends and tendencies in the relevant user's behavior (737; par. 190, lines 8-12; par. 29, lines 7-10; par. 39, lines 30-33; par. 128; par. 18; in which the snapshot is maintained for longer/continuing time period for analyzing/finding future trends and patterns in content experienced/interacted as discussed above); and

pushing (recommending content) to the relevant user in accordance with the patterns, trends, and tendencies developed from the snapshots (par. 147, lines 1-8; content is recommended based on the user model which is in accordance with the patterns, trends, and tendencies developed from the snapshots).

However Arellano fails to specifically disclose:

analyzing a plurality of the snapshots; and

wherein the analyzing code makes use of modal non-monotonic logic;

In an analogous art Akella teaches it is desirable to analyze a series of snapshots in order to detect changes in user information and determine historical trends (Abstract; par. 9; par. 10, lines 1-5; par. 23, lines 1-6; par. 24; par. 27, lines 15-21).

Therefore it would have been obvious to one of ordinary skill in the art to modify the system of Arellano to include analyzing a series of the snapshots as taught by Akella for the added advantage of reduced memory requirements and more efficiently determining when, why and how new snapshots are taken (Akella – par. 24).

However, Arellano and Akella fail to teach:

wherein the analyzing step makes use of modal, non-monotonic logic;

In an analogous art, Thuraisingham teaches modal non-monotonic logic is used to make deductions and gives new complete answers to queries – col. 56, line 62 - col. 57, line 60, col. 47, lines 43-62, col. 49, lines 10-67, col. 51, lines 12-15.

It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify Arellano and Akella's invention to include the above mentioned limitation, as taught by Thuraisingham, for the advantage of having a

machine automatically reason and draw inferences to come up with answers which are more accurate and more reliably ranked.

However, Arellano, Akella, and Thuraisingham fails to specifically disclose wherein the captured relevant user's behavior includes a record of play sequence commands.

In an analogous art Aras teaches at least one record of play sequence commands for monitoring user behavior (col. 14, lines 8-20).

It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify Arellano, Akella, and Thuraisingham's invention to include the above mentioned limitation, as taught by Aras, for the advantage of collecting user behavior.

Regarding claim 35 it is analyzed and rejected similar to claim 7 above.

Regarding claim 37, Arellano in view of Akella and Thuraisingham teach the operations further comprise

capturing content (movies) summaries (EPG/characterizations) of the content experienced by the relevant user (par. 109, lines 16-21; par. 100; par. 112; par. 148);
and

analyzing the captured content (par. 88; par. 91, lines 1-6; par. 114; par. 127, lines 6-16) and content summaries (par. 110,127) and behaviors (par. 88,114,128) to create updated personal data (par. 88; 153; 321-322);

updating the adaptive memory with the updated personal data (par. 128; par. 139-140; par. 105, lines 1-3,9-13; par. 139-140).

Regarding claim 38, Arellano in view of Akella, Thuraisingham, and Aras teach the operations further comprise interfacing with the user (Arellano-par. 117-126; par. 110; par. 183; par. 154-155; par. 27, lines 10-12) and acquiring more data from the user (par. 128; par. 114, lines 7-9).

Regarding claim 41, Arellano in view of Akella, Thuraisingham, and Aras teach interfacing further comprises one of recommending new content based on the adaptive personal memory (Arellano-par. 147, lines 1-8).

Claim 42 contains the limitations of claim 34 and is analyzed as previously discussed with respect to that claim.

Claim 43 contains the limitations of claim 10 and is analyzed as previously discussed with respect to that claim.

10. Claims 17, 20, 24, 25, 29-30, and 33 are rejected under 35 U.S.C. 103(a) as being unpatentable over Arellano et al. (US 2004/0128624 A1) in view of Thuraisingham and Aras.

Regarding claims 17, 29, and 30, Arellano teaches a data processing system comprising an adaptive memory (fig. 18-20; par. 128; par. 174; par. 92, lines 3-6, 9-11; par. 39, lines 29-33; par. 42, lines 1-6; par. 82, lines 4-7; par. 84, line 9; par. 105, line 9; par. 193-195) with a hierarchy (par. 100, lines 5-8; par. 176; par. 177, lines 12-16; par. 890; par. 908, lines 1-5, 14-15) of linked (correlated) nodes (groups and subgroups of features that comprise content elements, e.g., keywords, content type, semantics, etc.) (fig. 25, 28, 30; par. 95; 112; par. 170; 173; 176; 747-749; 881-882) and weak links outside the hierarchy (links to other index nodes that are not based on the subcategories of information/content, i.e., the feature/feature-value nodes) (situation-action pairs, do not fit into the pragmatic feature-value hierarchy which is application specific, i.e., content based [par. 136, 138; par. 19, lines 7-11 & par. 21, lines 1-8; par. 91, lines 1-7], and are used to provide other cognitive nodes, i.e., categorizing groups and sub-groups, based on a user's goals or persona, which are not connected to the application/content hierarchy; par. 139-140; par. 19, lines 4-7; par. 171, lines 10-13; fig. 13; par. 91; par. 20; par. 21, lines 16-19; par. 83);

at least one processor which maintains the adaptive memory in accordance with ongoing user behaviors and content experience by implementing code for performing operations including:

forming at least one query, responsive to the adaptive memory (par. 105, lines 11-13; par. 153), for one of recommending new content based on the adaptive personal memory (par. 147, lines 1-8; in which the analysis engine queries the user model/memory) and capturing content experienced by a the user (par. 190, lines 6-12;

par. 84, lines 9-11; par. 88, lines 4-6; par. 89, 127,128; par. 171, lines 1-7) and the user's relevant behavior (par. 85, lines 5-9; par. 88, lines 5-11; par. 90; par. 91, lines 7-11; par. 92, line 3-6; par. 114, lines 3-9; par. 190, lines 12-17);

analyzing the experienced content (par. 88; par. 91, lines 1-6; par. 114; par. 127, lines 6-16), the user behavior (par. 88,114,128), and responses to the at least one query (par. 153,114) to create updated data (par. 88; 153; 321-322); and

updating the adaptive memory with the updated data (par. 105, lines 1-3,9-13; par. 139-140).

Arellano further teaches the systems logic/reasoning processes are introspective and continuously reevaluate the importance of features of the user model (par. 92, lines 3-9) and further that the system uses heuristics, i.e., trial-and-error, to generate presentations (par. 125). Arellano even further teaches that when a user desires to expand/discover new content the system reanalyzes the model logic and determines the relevance/effectiveness of the model logic so that the system is self-improving (par. 127, line 6-par. 128; par. 321-322) and that the user model is based on the user's continuing tendency to select certain contents/subjects, i.e., the current models prediction logic is contingent upon the user's future possible actions which may change over time accordingly changing the models prediction logic (par. 190), e.g., the user may continuously view www.xyz.com/bowling this week so the current model logic adapts the browser to automatically go to that page when the user request www.xyz.com, however in the future if the user's tendency changes to going to www.xyz.com/fishing instead the model prediction logic will adapt of change because

Art Unit: 2623

the past logic is no longer valid therefore the model logic is contingent upon predictions being held true or false [par. 910]. Even furthermore Arellano teaches the system is a multi-agent, multi-paradigm (multi-standard) modeling system (par. 84, lines 9-11) that may represent content with a plurality of representations (par. 751-752). Arellano even further teaches the system is an MVC that promotes modularity and decoupling of application data/content from the mechanisms that manipulate the data which enables software reuse (interoperability) (par. 107).

However, Arellano fails to teach:

using of modal, non-monotonic logic;

wherein the user behavior includes a record of play sequence commands;

In an analogous art, Thuraisingham teaches modal, non-monotonic logic is used to make deductions and gives new complete answers to queries – col. 56, line 62 - col. 57, line 60, col. 47, lines 43-62, col. 49, lines 10-67, col. 51, lines 12-15.

It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify Arellano's invention to include the above mentioned limitation, as taught by Thuraisingham, for the advantage of having a machine automatically reason and draw inferences to come up with answers which are more accurate and more reliably ranked.

However, Arellano and Thuraisingham fail to teach:

wherein the user behavior includes a record of play sequence commands;

In an analogous art Aras teaches at least one record of play sequence commands for monitoring user behavior (col. 14, lines 8-20).

It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify Arellano and Thuraisingham's invention to include the above mentioned limitation, as taught by Aras, for the advantage of collecting user behavior.

Regarding claims 20, 25 and 33, they are analyzed and rejected similar to claim 9 above.

Regarding claim 24 it is analyzed and rejected similar to claim 7 above.

11. Claims 18 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Arellano et al. (US 2004/0128624 A1), Thuraisingham, and Aras, as applied to claim 17 above and further in view of Sezan et al. (US 2005/0091686 A1).

Regarding claims 18, Arellano in view of Thuraisingham and Aras teach seeking (identifying) new content having content models in common with previously experienced (interacted) content (Arellano-par. 112; par. 147; par. 91, lines 6).

However Arellano in view of Thuraisingham and Aras fail to specifically disclose a participant.

In an analogous art, Sezan teaches it is desirable to identify participants (e.g., directors, actors, etc.) in new content in common with previously watched content for

searching and filtering out content of preferred by the user (par. 47, lines 1-7; par. 41, lines 3-10; par. 42, lines 21-35; par. 45, lines 20-27).

Therefore it would have been obvious to one of ordinary skill in the art at the time of the Applicant's invention to modify the system of Arellano in view of Thuraisingham and Aras to include the limitation a participant as taught by Sezan for the advantage of increasing user convenience and satisfaction by identifying new content the user would like by enabling the user model/profiler to acknowledge the user's preferred actors, directors, etc.

Regarding claims 19, Arellano in view of Thuraisingham and Aras teach seeking (identifying) new content having content models in common with previously experienced (interacted) content (Arellano-par. 112; par. 147; par. 91, lines 6).

However Arellano in view of Thuraisingham and Aras fail to specifically disclose summary information.

In an analogous art, Sezan teaches it is desirable to identify summary (program profile, e.g., stars in the movie, rating, keywords, categories, etc.) information in new content in common with previously watched content for searching and filter out content of preferred by the user (par. 47, lines 1-7; par. 41, lines 3-10; par. 42, lines 21-35; par. 45, lines 20-27).

Therefore it would have been obvious to one of ordinary skill in the art at the time of the Applicant's invention to modify the system of Arellano in view of Thuraisingham and Aras to include the limitation summary information as taught by Sezan for the

advantage of increasing user convenience and satisfaction by identifying new content the user would like by enabling the user model/profiler to acknowledge the user's preferred content profiles.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
